Clinicians are often presented with older ferrets exhibiting ataxia, intermittent collapse, exercise intolerance, changes in appetite, and/or muscle mass loss. This virtual master class will explore the differential diagnoses for the collapsing ferret. In addition to islet cell disease, dental, cardiac, renal, and musculoskeletal diseases as well as other types of neoplasia may be the root cause of these presenting signs. Case reports illustrating more common reasons for collapsing geriatric ferret will be discussed.

Learning Objectives

- Understand basic ferret anatomy and physiology as it relates to metabolism and disease
- Develop an appropriate differential diagnoses list
- Provide urgent care to the collapsing ferret
- Identify and obtain appropriate diagnostics, including imaging
- Develop a diagnosis-based treatment plan, including client education
